Objective

The Candela mixed traffic test is designed to measure the access point performance and stability by running multiple traffic on real clients like Android, Linux, Windows, and iOS connected to the access point. This test allows the user to choose multiple types of traffic like client capacity test, web browser test, video streaming test ping test. Along with the performance measurements are client connection times, Station 4-Way Handshake time, DHCP times, and more. The expected behavior is for the AP to be able to handle all types of traffic on the several stations (within the limitations of the AP specs) and make sure all clients can run all types of traffic.

No.of times file Download

The below graph represents number of times a file Download for each client (WiFi) traffic. X-axis shows "No of times file Download" and Y-axis shows "Client names".

No of times file Download (Count)

Average time taken to Download file

The below graph represents average time taken to Download for each client (WiFi) traffic. X-axis shows "Average time taken to Download a file " and Y-axis shows "Client names".
